

Negative-OR

Example

$$Y = (\overline{AB})(\overline{CD})$$

From Demorgan Theorem

$$Y = \overline{\overline{AB}} + \overline{\overline{CD}}$$

Then Y = AB + CD

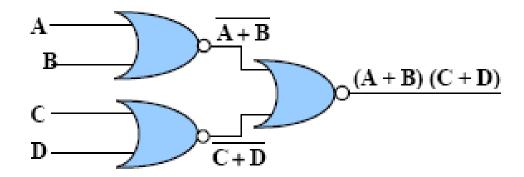

$$\overline{A + B} = \overline{A} \bullet \overline{B}$$

NOR______

Negative-AND

$$Y = \overline{(\overline{A + B}) + (\overline{C + D})}$$

From Demorgan Theorem

$$Y = (\overline{\overline{A + B}}) \bullet (\overline{C + D})$$

$$Y = (A + B) \bullet (C + D)$$

Exclusive-OR Gate XOR-gate

I	IN		
Α	В	У	
0	0	0	A'B'
0	1	1	A'B
1	0	1	AB'
1	1	0	AB

$$Y = \overline{A}B + A\overline{B}$$

$$Y = A \oplus B$$

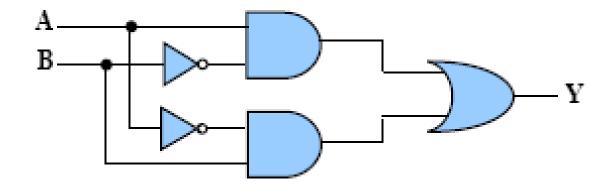

$$Y = \overline{A}B + A\overline{B}$$

$$Y = A \oplus B$$

Follow The Design Procedures

(1) Determine inputs: A&B

Determine outputs: S&C

(2) Derive the truth table:

A	В	S	С
0	0	0	0
0	1	1	0
1	0	1	0
1	1	0	1

(3) Obtain the simplified Boolean functions:

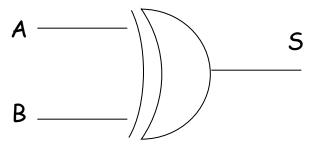

$$S = A' B + A B' = A \oplus B$$

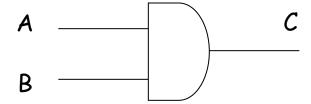

$$C = A B$$

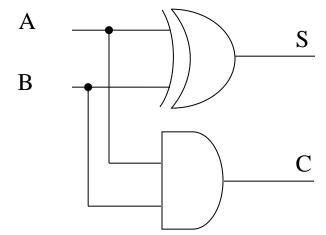

Draw the logic diagram:

(5) Verify the correctness of the design:

Full Adder

(1) Inputs: A, B Cin

Output: S, C

(2)

A	В	Cin	S	С
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0
0	1	1	0	1
1	0	0	1	0
1	0	1	0	1
1	1	0	0	1
1	1	1	1	1

(3) S= A' B' Cin + A' B Cin' + A B' Cin' + A B Cin C= A' B Cin + A B' Cin + A B Cin' + A B Cin

(3) S= A' B' Cin + A' B Cin' + A B' Cin' + A B Cin

C= A' B Cin + A B' Cin + A B Cin' + A B Cin

S = (A' B + AB') Cin' + (A' B' + A B) Cin

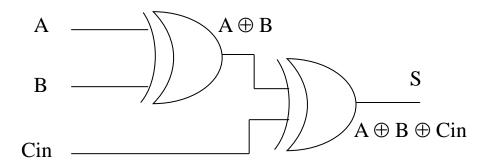

$$= (A \oplus B) Cin' + (A \odot B) Cin$$

= (
$$A \oplus B$$
) $Cin' + (A \oplus B) Cin$

$$= A \oplus B \oplus Cin$$

Cin = Y;
$$A \oplus B = X$$

 $\therefore S = XY' + X'Y \Rightarrow S = X \oplus Y$

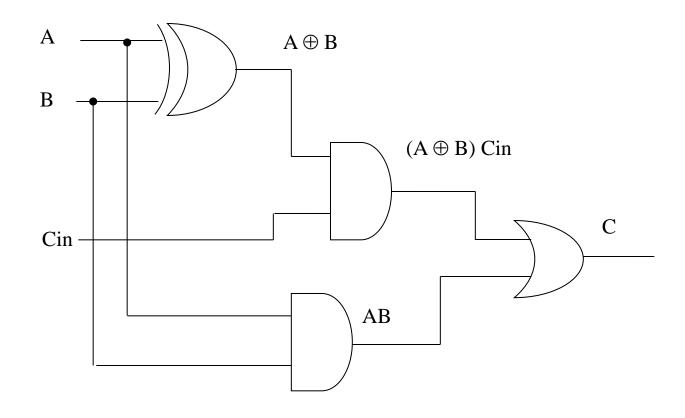

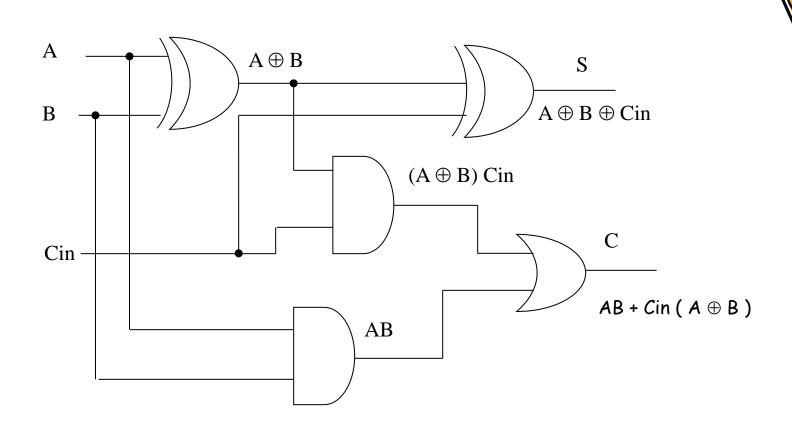

$$C = AB (Cin + Cin') + Cin (A'B + AB')$$

= $AB + Cin (A \oplus B)$

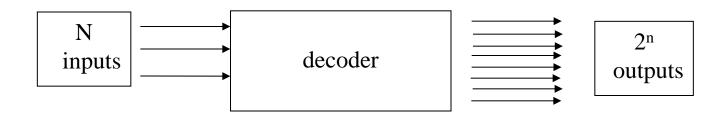

Decoders

Decoders are important type of combinational circuit. Address decoders with n inputs can select any of 2^n locations.

They are useful in selecting a memory location according a binary value place don the address lines of a memory bas.
